EXOTIC Installation Instructions for Mac Users

There are two ways you can run EXOTIC, either in the Google Collab or on your own personal machine using the command line. Please review the details of the two processes below and select the best option for you.

Google Collab:

Running EXOTIC in the Google Collab is the recommended option for new users, those who are unfamiliar with using the command line, students, and those analyzing data via remote observatories. To install and run EXOTIC in the Google Collab, please follow this link to the set of instructions:

https://docs.google.com/document/d/1GLnfX1DdGPpd1ArKNcoF2GGV6pw KR3aEYuwjSQIhiZQ/edit?usp=sharing

Command line:

If you feel comfortable using the command line, are reducing large data sets, or are looking to learn more about EXOTIC and how to run it on your own machine, follow the set of instructions on the following pages:

I. Download DS9 (Astronomical Image Viewing Software)

- Follow the link: https://sites.google.com/cfa.harvard.edu/saoimageds9?pli=1&a
 uthuser=1
- Download the version corresponding to the Mac operating system.
- Run the installer once downloaded.
- Follow the instructions in the installer to complete the installation.

<u>Note:</u> This software will be used to view the ".FITS" images you obtain during observations. For more information on DS9, check out the User Guide: http://ds9.si.edu/doc/user/index.html

II. Open the Terminal app

- Select Launch Pad on the Task Bar
- Double-click Terminal
- When opening Terminal for the first time, you might be prompted to enter a password. Enter your new password and take note of it. You will be prompted again later to enter it. If you are not prompted to add one, your password will be the same as the password for the computer account you are currently working on.

Note: The Terminal app allows you to perform actions on your computer (run python programs, install applications, edit files, etc.) by typing in commands. If you are interested in learning more about the terminal and the different commands you can use, follow this link: https://www.macworld.com/article/2042378/master-the-command-line-navigating-files-and-folders.html

III. Execute the following commands in your Terminal's command line:

- If you have yet to download EXOTIC
 - o Type "cd /PATH/" replacing PATH with the directory you want the EXOTIC folder to be downloaded in. For example, typing "cd Documents" will mean that the EXOTIC files will be stored in Users/your username/Documents/EXOTIC/.
 - This will also be the location in which you run the program.

<u>Note:</u> cd stands for "Change Directory". In executing this command, you are navigating to your Downloads folder, just as you would by double-clicking on Downloads in File Explorer.

mjs2369@DESKTOP-R2PG3MN:~\$ cd /mnt/c/Users/Marlena\ Smith/Documents/
mjs2369@DESKTOP-R2PG3MN:/mnt/c/Users/Marlena Smith/Documents\$

- Install Python (or update Python to the latest version) on your Mac by using the command '/bin/bash -c "\$(curl fsSL
 - https://raw.githubusercontent.com/Homebrew/install/master/install.sh)" 'followed by 'brew install python'. Do not include the single quotes and spaces at the beginning and end of the command.
- Run the command 'pip3 install exotic || pip install exotic'.
 This command will install EXOTIC and all necessary
 Python packages used to run EXOTIC.
- Wait a while. This process may take several minutes.
- Type 'exotic' and hit enter. You should see the introductory header to EXOTIC as pictured at the bottom of this document, which tells you that it is all up and running!

- If you have already downloaded EXOTIC using GitHub
 - Navigate into your EXOTIC directory by typing "cd /PATH/" – replacing PATH with the directory the EXOTIC files are stored in.
 - For example, type "cd Documents/EXOTIC/ if the EXOTIC folder is stored in your documents. /Users/your_username/Documents/EXOTIC/ would be your current directory listed on the screen.
 - This will also be the location in which you run the program.

<u>Note:</u> cd stands for "Change Directory". In executing this command, you are navigating to your Downloads folder, just as you would by double-clicking on Downloads in File Explorer.

njs2369@DESKTOP-R2PG3MN:~**\$ cd /mnt/c/Users/Marlena\ Smith/Documents/EXOTIC/** njs2369@DESKTOP-R2PG3MN:/mnt/c/Users/Marlena Smith/Documents/EXOTIC**\$**

- Type "chmod 755 exotic_installation_mac.sh" do not include the quotes.
- Hit Enter.
 - Note: this command alters the file you downloaded "exotic_installation_mac.sh" to be executable (i.e. you can now run it in your terminal).
- Type "./exotic_installation_mac.sh" do not include the quotes.
- o Hit Enter.
- Enter the password you created earlier (or already had) if prompted.
 - Note: this command runs the file you downloaded, which is called a script. A script is simply a list of commands to be executed in the Terminal. This script will download Python (unless you already have it) and install all the necessary packages to

run EXOTIC. Finally, the script will run EXOTIC to test that it is functional.

- Wait a while. This process may take several minutes.
- Once the process has completed, you should see the introductory header to EXOTIC as pictured at the bottom of this document, which tells you that it is all up and running!

If you are seeing this header in your terminal, EXOTIC is successfully installed, and you are ready to begin analyzing exoplanet data!

To learn how to run the code and how EXOTIC works, check our other guides on GitHub!
